VPDES PERMIT FACT SHEET

This document gives pertinent information concerning the reissuance of the VPDES permit listed below. This permit is being processed as a **Minor Industrial** permit. The effluent limitations contained in this permit will maintain the Water Quality Standards of 9 VAC 25-260. The discharges result from storm water associated with industrial activity and non-contact cooling water used during the enhancement of polyester films through processes including dyeing, metallizing, and sputtering. The permit action consists of reissuing the permit for a five-year term with limitations on the non-contact cooling water for temperature and pH. The permit also addresses storm water pollution prevention.

1. Facility Name and Address:

Part II. NPDES Draft Permit Checklist

Region III NPDES Permit Quality Checklist – for POTWs

NA

(To be completed and included in the record only for POTWs)

II.A. Permit Cover Page/Administration	Yes	No	N/A
Does the fact sheet or permit describe the physical location of the facility, including latitude and longitude (not necessarily on permit cover page)?			
Does the permit contain specific authorization-to-discharge information (from where to where, by whom)?			

II.B. Effluent Limits – General Elements	Yes	No	N/A
Does the fact sheet describe the basis of final limits in the permit (e.g., that a comparison of technology and water quality-based limits was performed, and the most stringent limit selected)?			
2. Does the fact sheet discuss whether "antibacksliding" provisions were met for any limits that are less stringent than those in the previous NPDES permit?			

11.0	C. Technology-Based Effluent Limits (POTWs)	Yes	No	N/A
1.	Does the permit contain numeric limits for <u>ALL</u> of the following: BOD (or alternative, e.g., CBOD, COD, TOC), TSS, and pH?			
2.	Does the permit require at least 85% removal for BOD (or BOD alternative) and TSS (or 65% for equivalent to secondary) consistent with 40 CFR Part 133?			0.40
	a. If no, does the record indicate that application of WQBELs, or some other means, results in more stringent requirements than 85% removal or that an exception consistent with 40 CFR 133.103 has been approved?			
3.	Are technology-based permit limits expressed in the appropriate units of measure (e.g., concentration, mass, SU)?			
4.	Are permit limits for BOD and TSS expressed in terms of both long term (e.g., average monthly) and short term (e.g., average weekly) limits?			
5.	Are any concentration limitations in the permit less stringent than the secondary treatment requirements (30 mg/l BOD5 and TSS for a 30-day average and 45 mg/l BOD5 and TSS for a 7-day average)?			
	a. If yes, does the record provide a justification (e.g., waste stabilization pond, trickling filter, etc.) for the alternate limitations?			

II.D. Water Quality-Based Effluent Limits	Yes	No	N/A
Does the permit include appropriate limitations consistent with 40 CFR 122.44(d) covering State narrative and numeric criteria for water quality?			
2. Does the fact sheet indicate that any WQBELs were derived from a completed and EPA approved TMDL?			

II.I	D. Water Quality-Based Effluent Limits – cont.	Yes	No	N/A
3.	Does the fact sheet provide effluent characteristics for each outfall?			1915 (S)
4.	Does the fact sheet document that a "reasonable potential" evaluation was performed?			idilinks Marria
	a. If yes, does the fact sheet indicate that the "reasonable potential" evaluation was performed in accordance with the State's approved procedures?			
	b. Does the fact sheet describe the basis for allowing or disallowing in-stream dilution or a mixing zone?			
	c. Does the fact sheet present WLA calculation procedures for all pollutants that were found to have "reasonable potential"?			
	d. Does the fact sheet indicate that the "reasonable potential" and WLA calculations accounted for contributions from upstream sources (i.e., do calculations include ambient/background concentrations)?			
	e. Does the permit contain numeric effluent limits for all pollutants for which "reasonable potential" was determined?			
5.	Are all final WQBELs in the permit consistent with the justification and/or documentation provided in the fact sheet?			
6.	For all final WQBELs, are BOTH long-term AND short-term effluent limits established?			
7.	Are WQBELs expressed in the permit using appropriate units of measure (e.g., mass, concentration)?			
8.	Does the record indicate that an "antidegradation" review was performed in accordance with the State's approved antidegradation policy?			

II.E. Monitoring and Reporting Requirements	Yes	No	N/A
Does the permit require at least annual monitoring for all limited parameter and other monitoring as required by State and Federal regulations?	ers		
a. If no, does the fact sheet indicate that the facility applied for and was granted a monitoring waiver, AND, does the permit specifically incorporately this waiver?	orate		
2. Does the permit identify the physical location where monitoring is to be performed for each outfall?			
3. Does the permit require at least annual influent monitoring for BOD (or Balternative) and TSS to assess compliance with applicable percent remove requirements?			
4. Does the permit require testing for Whole Effluent Toxicity?			

II.F. Special Conditions	Yes	No	N/A
Does the permit include appropriate biosolids use/disposal requirements?			
Does the permit include appropriate storm water program requirements?			

II.I	F. Special Conditions – cont.			Yes	No	N/A
3.	If the permit contains complian statutory and regulatory deadl	nce schedule(s), are they consister ines and requirements?	nt with			
4.		e.g., ambient sampling, mixing stud tent with CWA and NPDES regulat				
5.		ze discharge of sanitary sewage fro) or CSO outfalls [i.e., Sanitary Sevasses]?				
6.	Does the permit authorize disc (CSOs)?	charges from Combined Sewer Ov	erflows			
	a. Does the permit require imp	elementation of the "Nine Minimum	Controls"?			
	b. Does the permit require dev Control Plan"?	velopment and implementation of a	"Long Term			
	c. Does the permit require mo	nitoring and reporting for CSO ever	nts?			
7.	Does the permit include appro	priate Pretreatment Program requi	rements?			
						T
II.C	3. Standard Conditions			Yes	No	N/A
		O CFR 122.41 standard conditions conditions?	or the State	Yes	No	N/A
1.	Does the permit contain all 40	conditions?	or the State	Yes	No	N/A

Part II. NPDES Draft Permit Checklist

Region III NPDES Permit Quality Review Checklist – For Non-Municipals (To be completed and included in the record for <u>all</u> non-POTWs)

11.7	A. Permit Cover Page/Administration	Yes	No	N/A
1.	Does the fact sheet or permit describe the physical location of the facility, including latitude and longitude (not necessarily on permit cover page)?	Χ		
2.	Does the permit contain specific authorization-to-discharge information (from where to where, by whom)?	X		

11.1	B. Effluent Limits – General Elements	Yes	No	N/A
1.	Does the fact sheet describe the basis of final limits in the permit (e.g., that a comparison of technology and water quality-based limits was performed, and the most stringent limit selected)?	Χ		
2.	Does the fact sheet discuss whether "antibacksliding" provisions were met for any limits that are less stringent than those in the previous NPDES permit?			X

II.C	C. Technology-Based Effluent Limits (Effluent Guidelines & BPJ)	Yes	No	N/A
1.	Is the facility subject to a national effluent limitations guideline (ELG)?		×	is either
	a. If yes, does the record adequately document the categorization process, including an evaluation of whether the facility is a new source or an existing source?			×
	b. If no, does the record indicate that a technology-based analysis based on Best Professional Judgement (BPJ) was used for all pollutants of concern discharged at treatable concentrations?		×	
2.	For all limits developed based on BPJ, does the record indicate that the limits are consistent with the criteria established at 40 CFR 125.3(d)?			×
3.	Does the fact sheet adequately document the calculations used to develop both ELG and /or BPJ technology-based effluent limits?			Х
4.	For all limits that are based on production or flow, does the record indicate that the calculations are based on a "reasonable measure of ACTUAL production" for the facility (not design)?			X
5.	Does the permit contain "tiered" limits that reflect projected increases in production or flow?		X	
	a. If yes, does the permit require the facility to notify the permitting authority when alternate levels of production or flow are attained?		,	X
6.	Are technology-based permit limits expressed in appropriate units of measure (e.g., concentration, mass, SU)?		÷	X

II.C. Technology-Based Effluent Limits (Effluent Guidelines & BPJ) – cont.	Yes	No	N/A
7. Are all technology-based limits expressed in terms of both maximum daily, weekly average, and/or monthly average limits?			X
Are any final limits less stringent than required by applicable effluent limitations guidelines or BPJ?		X	27 E

11.1	D. Water Quality-Based Effluent Limits	Yes	No	N/A
1.	Does the permit include appropriate limitations consistent with 40 CFR 122.44(d) covering State narrative and numeric criteria for water quality?	X		
2.	Does the record indicate that any WQBELs were derived from a completed and EPA approved TMDL?		×	
3.	Does the fact sheet provide effluent characteristics for each outfall?	X		
4.	Does the fact sheet document that a "reasonable potential" evaluation was performed?	×		
:	a. If yes, does the fact sheet indicate that the "reasonable potential" evaluation was performed in accordance with the State's approved procedures?	X		
_	 Does the fact sheet describe the basis for allowing or disallowing in-stream dilution or a mixing zone? 	X		-
	c. Does the fact sheet present WLA calculation procedures for all pollutants that were found to have "reasonable potential"?			X
	d. Does the fact sheet indicate that the "reasonable potential" and WLA calculations accounted for contributions from upstream sources (i.e., do calculations include ambient/background concentrations where data are available)?	×		
	e. Does the permit contain numeric effluent limits for all pollutants for which "reasonable potential" was determined?			X
5.	Are all final WQBELs in the permit consistent with the justification and/or documentation provided in the fact sheet?	X		
6.	For all final WQBELs, are BOTH long-term (e.g., average monthly) AND short-term (e.g., maximum daily, weekly average, instantaneous) effluent limits established?			×
7.	Are WQBELs expressed in the permit using appropriate units of measure (e.g., mass, concentration)?			×
8.	Does the fact sheet indicate that an "antidegradation" review was performed in accordance with the State's approved antidegradation policy?	X		

II.E	E. Monitoring and Reporting F	Requirements		Yes	No	N/A
1.	Does the permit require at leas	parameters?	X			
		licate that the facility applied for an , AND, does the permit specifically				X
2.	Does the permit identify the ph performed for each outfall?	×				
3.	Does the permit require testing the State's standard practices?	for Whole Effluent Toxicity in acc	ordance with		×	
II.F	F. Special Conditions			Yes	No	N/A
1.	Does the permit require development Practices (BMP)	ppment and implementation of a Beplan or site-specific BMPs?	est		×	ist.
	a. If yes, does the permit adequate BMPs?	uately incorporate and require com	pliance with			×
If the permit contains compliance schedule(s), are they consistent with statutory and regulatory deadlines and requirements?						×
3. Are other special conditions (e.g., ambient sampling, mixing studies, TIE/TRE, BMPs, special studies) consistent with CWA and NPDES regulations?						
II.C	G. Standard Conditions			Yes	No	N/A
1.	Does the permit contain all 40 equivalent (or more stringent) of	CFR 122.41 standard conditions conditions?	or the State	X		ndhydpyni 3-3-1-11
Lis	st of Standard Conditions – 40	CFR 122.41

^{*} Maximum daily flow reported on Form 2E

See Attachment A for a site map showing the facility, outfalls and storm water drainage areas.

The CPFilms facility consists of two plants (#1 and #2) engaged in the enhancement of polyester films through processes including dyeing, metallizing, and sputtering. Cooling water is needed in these processes and is provided either by a closed-loop chiller system or a once-through non-contact cooling system using water from the Smith River. The closed-loop system is the normal mode of cooling, but river water is used in emergency situations or when the closed-loop system is down for maintenance. Water can be pumped from the river at a rate of 3000 gallons per minute with a maximum daily use of just over two million gallons per day. Approximately two-thirds of the water is routed to plant #1 and is discharged to the Smith River from outfall 001. The remaining water is used at plant #2 and is discharged through outfall 002 to the Smith River. The intake water is screened to catch debris, which is periodically blown back into the river.

All process wastewater is directed to one of two pretreatment lagoons operated in series. (All sanitary sewage is directed to the lagoon at Plant #1.) The wastewater is then treated through an on-site treatment plant prior to discharge to the Henry County collection system, which discharges to the City of Martinsville STP for treatment. Sludge is dried on drying beds, removed to a dumpster and disposed of by an outside contractor.

Storm water is discharged through six point sources on the site. Outfall 001 receives some runoff from drop inlets in a grassy area outside of plant #1. (A loading dock is also located within this drainage area.) In addition, five "storm water only" outfalls were identified.

The majority of the remaining storm water from plant #1 is discharged through Outfall 003 to an unnamed tributary of the Smith River. Some storage of scrap metal and wooden palettes occurs in this drainage area which is mostly grassy with some asphalt parking area. A propane tank is also located within this storage area. Storm water runoff from around the WWTP (used for pretreatment) is diverted back into the treatment system.

9. Description of Facility Activities (continued):

Outfall 007 drains approximately 15,000 square feet of impervious (paved) surface from Plant 1. The outfall discharges to an unnamed tributary of the Smith River just downstream of Outfall 003.

The remaining three sources of storm water drain from plant #2. Outfall 005 receives the majority of the storm water "associated with industrial activity" at plant #2. There is some storage of scrap metals and raw materials including stainless steel and aluminum. There are also wooden pallets stored in this drainage area. Drum storage is under cover with concrete berms to retain any spills. The tank farm (consisting of ethylene glycol, N-methyl pyrrolidone, and a mixture of the two) is exposed to storm water but is diked with a three-foot concrete wall. A synthetic liner was placed within the concrete wall and the area is also enclosed with an earthen berm. Piping is in place to route any spills or contaminated storm water to the pretreatment lagoons. A propane tank is also located within this drainage area.

Outfall 006 drains a grassy field. Outfall 004 drains the main parking area as well as some grassy areas. By definition, the storm water discharged through outfall 006 is not considered to be "associated with industrial activity".

10. Sewage Sludge Use or Disposal: Provide a description of sewage sludge land application plan elements addressed in permit, if applicable.

Not applicable. No sewage sludge from the facility is land applied.

11. Discharge(s) Location Description:

The facility is located on the Martinsville West, VA Quadrangle. (Please see Attachment A.)

Outfall 001 location: Latitude 36°43'38" Longitude 79°56'55" Outfall 002 location: Latitude 36°43'42" Longitude 79°57'03"

12. Material Storage:

As can be seen on the site map, there are numerous above ground storage tanks onsite. The majority of the tanks is contained within a concrete diked area with a synthetic liner further enclosed with an earthen berm and/or is under roof. Piping is in place to route any spills or contaminated storm water to the pretreatment lagoons. There is some storage of wooden pallets, scrap metals and raw materials including stainless steel and aluminum. Structural (dikes, berms, swales, ditches, and underground conveyances) and non-structural (personnel training, good housekeeping, routine inspections, and Spill Prevention, Control, and Countermeasure Plan) measures are in place to reduce pollutants in storm water run-off.

Fertilizers and lime are applied to the facility grounds periodically and the herbicide "Round-Up" is used as needed for weed control in asphalt and concrete areas.

Please see Attachment A for a site map showing location of storage tanks and a corresponding listing of quantities of materials stored.

13. Ambient Water Quality Information:

Non-contact cooling water from the site discharges through Outfalls 001 and 002 to the Smith River at river mile 35.29 and 35.45, respectively. Storm water is also discharged to the Smith River and an unnamed tributary to the Smith River. These receiving streams are classified as Class VI (Natural Trout) waters with a special standard designation as a Public Water Supply (PWS). Flow frequencies for the Smith River were determined using the continuous record gauge on the Smith River at Bassett, VA (#02072500) and proportional drainage areas. CPFilms operates a surface water intake at river mile 35.41. Please see the Flow Frequency Determination memo in **Attachment B** for further details.

The nearest ambient water quality monitoring station is located downstream on the Smith River at river mile 33.19 (4ASRE033.19) with the nearest upstream station located at river mile 43.54 (4ASRE043.54). Summaries of the data are tabulated in **Attachment B**. The 2010 303(d) report lists this segment of the Smith River (from the mouth of Blackberry Creek downstream to the backwaters of the Martinsville power pool) for a bacteria impairment; recreation use is not supported. Sources of the impairment include: municipal (urbanized high density area), unspecified domestic waste, wet weather discharges (non-point source, point source and combinations of storm water, SSO or CSO). A copy of the pertinent section of the 2010 Impaired Waters Fact Sheet can be found in **Attachment B**.

The permittee reported there were no significant spills or leaks at the facility during the past three years. (See Form 2F.)

14.	Antide	gradation Re	eview & Comments:		
	Tier:	Ι	II_	_XX	III

The State Water Control Board's Water Quality Standards includes an antidegradation policy (9 VAC 25-260-30). All state surface waters are provided one of three levels of antidegradation protection. For Tier 1 or existing use protection, existing uses of the water body and the water quality to protect these uses must be maintained. Tier 2 water bodies have water quality that is better than the water quality standards. Significant lowering of the water quality of Tier 2 waters is not allowed without an evaluation of the economic and social impacts. Tier 3 water bodies are exceptional waters and are so designated by regulatory amendment. The antidegradation policy prohibits new or expanded discharges into exceptional waters.

The antidegradation review begins with the Tier determination. Public water supplies and trout streams are assumed to be Tier 2 unless information is available to indicate otherwise. As was previously noted, this segment of the Smith River is classified as both a public water supply and a natural trout water. Although the stream segment has been listed on the 303(d) list for bacteria impairment, agency guidance states that non-attainment of the bacteria criteria will not be used to establish the tier category of a water unless there is clear and convincing evidence that the elevated bacteria numbers are due to inadequately disinfected human waste. Therefore, this segment of the Smith River is determined to be a Tier 2 water body.

Since the quality of Tier 2 waters is better than required by the standards, no significant degradation of the existing quality will be allowed. For purposes of aquatic life protection, "significant degradation" means that no more that 25% the difference between the acute and chronic aquatic criteria values and the existing quality (unused assimilative capacity) may be allocated. For purposes of human health protection, "significant degradation" means that no more than 10% of the difference between the human health criteria and the existing quality (unused assimilative capacity) may be allocated. The significant degradation baseline (antidegradation baseline) for aquatic life protection is calculated for each pollutant as follows:

14. Antidegradation Review & Comments (continued):

0.25 (WQS - existing quality) + existing quality = Antidegradation baseline

The antidegradation baseline for human health protection is calculated for each pollutant as follows:

The "antidegradation baselines" become the new water quality criteria in Tier 2 waters and effluent limits for future expansions or new facilities must be written to maintain the antidegradation baselines for each pollutant.

Effluent limitations are discussed in detail in Section 16 below. The discharge is in compliance with antidegradation requirements set forth in the Water Quality Standard Regulation, 9 VAC 25-260-30. The antidegradation review was conducted as described in Guidance Memorandum 00-2011, dated August 24, 2000, and complies with the antidegradation policy contained in Virginia's Water Quality Standards.

- 15. Site Visit: Date September 16, 2010 Performed by: Troy Nipper

 A Technical Inspection was conducted on September 16, 2010, by Troy Nipper, Environmental Inspector. A copy of the report is on file at the DEO Blue Ridge Regional Office in Roanoke.
- 16. Effluent Screening & Limitation Development:

This facility qualifies as a minor industrial with standard limits for non-contact cooling water discharges. A review of the DMR data for the past five years indicates the facility is in compliance with the current limitations. The limitations from the previous permit were reviewed and carried forward as appropriate. Effluent screening and limitation development documentation may be found in **Attachment C**.

Storm water discharges from the facility are regulated as "storm water associated with industrial activity". Evaluation of storm water management requirements is discussed below.

Outfall 001

This discharge consists of non-contact cooling water and some of the storm water originating from plant #1. Water is pumped from the Smith River, passed through various non-contact cooling operations, and is discharged back to the river. Standard limitations for non-contact cooling water include temperature and pH. The segment of the receiving stream is considered to be natural trout water (class VI) with a maximum temperature limit of 20°C. In addition, in accordance with VR680-21-01.6, the rise above natural temperature shall not exceed 1°C. The standard pH limitations apply (6.0 - 9.0).

<u>Toxics</u> – During a previous permit reissuance process, effluent data for toxic parameters were evaluated for the reasonable potential to cause or contribute to violations of the Water Quality Standards adopted by the Board. None of the parameters where detected at levels above the quantification level specified by the permit. Therefore no limitations were needed. There have been no significant changes in the operations of the plant since that analysis.

16. Effluent Screening & Limitation Development (continued):

Outfall 002

The discharge from this outfall consists entirely of non-contact cooling water from plant #2. As with outfall 001, the temperature and pH limitations are based upon the requirements for natural trout waters. The maximum temperature limit of 20° C, the maximum rise above natural temperature of 1° C, and the standard pH limitations of 6.0 - 9.0 apply.

<u>Toxics</u> – During the last permit reissuance process, effluent data for toxic parameters were evaluated for the reasonable potential to cause or contribute to violations of the Water Quality Standards adopted by the Board. None of the parameters where detected at levels above the quantification level specified by the permit. Therefore no limitations were needed. There have been no significant changes in the operations of the plant since that analysis.

Basis for Effluent Limitations – Outfalls 001 and 002

STORMWATER (Outfalls 001, 003, 004, 005, 006, and 007)

Storm water is discharged from this site through six outfalls. In accordance with the VPDES Permit Regulation (9 VAC 25-31-10 et seq.), storm water run-off from this site is regulated as storm water associated with industrial activity. All permits that authorize storm water discharges associated with industrial activity must include storm water management provisions. The five components of the storm water management provisions are: effluent limitations and compliance monitoring, analytical monitoring, storm water management evaluation, general storm water special conditions, and general and sector-specific storm water pollution prevention plan (SWPPP) conditions.

Based upon the Standard Industrial Classification (SIC) code of this facility, the storm water discharges are regulated under the "Paper and Allied Products" sector (Converted Paper and Paperboard Products, Except Containers and Boxes subcategory). EPA Effluent Guidelines do not apply to this sector. Therefore, effluent limitations and compliance monitoring are not required. Similarly, there is no prescribed analytical monitoring for these facilities because, due to the nature of the industrial activity or materials stored on site, they do not have significant potential to contribute pollutants to their storm water discharges.

The need for a storm water management evaluation is determined by comparing available storm water data to the screening criteria. Screening criteria are established at two times the acute water quality criteria in the Water Quality Standards regulation. Storm water data for water quality standards parameters are not available for these discharges because no storm event monitoring is required by the

16. Effluent Screening & Limitation Development (continued):

permit. Therefore, storm water management evaluation requirements are not being implemented at this time. It is noted that the permittee did not complete the data requirements for EPA Form 2F for the permit application. Collection of this data will be required during the first year of this permit term.

The final two components of the storm water management provisions are the general storm water conditions, and the general and sector-specific storm water pollution prevention plan conditions. These will be addressed under the special conditions of the permit and Section 19 of this Fact Sheet.

17. Antibacksliding Statement:

All limitations are at least as stringent as the previous permit. The permit is in compliance with the antibacksliding policy.

18. Compliance Schedules: None

19. Special Conditions:

a. Notification Levels

Rationale: Required by VPDES Permit Regulation, 9 VAC 25-31-200 A for all manufacturing, commercial, mining, and silvicultural dischargers.

b. Materials Handling/Storage

Rationale: 9 VAC 25-31-50 A prohibits the discharge of any wastes into State waters unless authorized by permit. Code of Virginia § 62.1-44.16 and 62.1-44.17 authorizes the Board to regulate the discharge of industrial waste or other waste.

c. Temperature Monitoring

Rationale: State Water Control Law § 62.1-44.21 authorizes the Board to request information needed to determine the discharge's impact on State waters. This special condition provides specific information regarding the measurement of temperature in the Smith River that must be reported on the Discharge Monitoring Report (DMR) each month.

d. Groundwater Monitoring

Rationale: State Water Control Law § 62.1-44.21 authorizes the Board to request information needed to determine the discharge's impact on State waters. The facility has been performing annual monitoring to assess the influence of the pretreatment lagoons on the groundwater. In addition, a risk assessment was completed in 1996, which identified the receptor to be the Smith River and concluded that the leaking lagoon did not present an appreciable risk to human health or the environment. While DEQ staff agreed with this conclusion, it was recommended that the permittee continue monitoring and consider taking action to reduce the source of pollutants.

e. Sampling to Fulfill Form 2F Requirements

Rationale: In some cases, applicants may not have been able to comply with the Form 2F storm water sampling requirements due to the lack of a representative storm event. This special condition requires the permittee to sample and submit data from a storm event to fulfill the requirements of Form 2F.

19. Special Conditions (continued):

f. TMDL Reopener

Rationale: Section 303(d) of the Clean Water Act requires that Total Maximum Daily Loads (TMDLs) be developed for streams listed as impaired. This special condition is to allow the permit to be reopened if necessary to bring it into compliance with any applicable TMDL approved for the receiving stream. The re-opener recognizes that, according to Section 402(o)(1) of the Clean Water Act, limits and/or conditions may be either more or less stringent than those contained in this permit. Specifically, they can be relaxed if they are the result of a TMDL, basin plan, or other wasteload allocation prepared under section 303 of the Act.

g. Storm Water Management

Rationale: VPDES Permit Regulation, 9 VAC 25-31-10 defines discharges of storm water from industrial activity in 9 industrial categories. 9 VAC 25-31-120 requires a permit for these discharges. The Storm Water Pollution Prevention Plan requirements of the permit are derived from the VPDES general permit for discharges of storm water associated with industrial activity, 9 VAC 25-151-10 et seq. VPDES Permit Regulation, 9 VAC 25-31-220 K, requires use of best management practices where applicable to control or abate the discharge of pollutants when numeric effluent limits are infeasible or the practices are necessary to achieve effluent limit or to carry out the purpose and intent of the Clean Water Act and State Water Control Law.

The storm water management requirements of the permit are divided into three sections: General Storm Water Special Conditions, General Storm Water Pollution Prevention Plan Requirements, and Sector-Specific Storm Water Pollution Prevention Plan Requirements. For facilities with an SIC Code of 2672, there are no sector-specific requirements and only the general requirements are included.

h. Part II, Conditions Applicable to All Permits

Rationale: VPDES Permit Regulation, 9 VAC 25-31-190 requires all VPDES permits to contain or specifically cite the conditions listed.

20.	NPDES Permit Rating Work Sheet:	Total Score	0

Please see Attachment A for completed rating work sheet. There have been no changes since the last permit reissuance.

21. Changes to Permit:

Changes in Effluent Monitoring/Limitations:

Outfall No.	Parameter Changed	Monitoring Requireme Changed	uirement		Limits	Reason	Date
		From	То	From	То		
001, 002	Temperature Rise	NA	NA	1°	1.0°	to include appropriate number of significant digits	4/18/11

21. Changes to Permit (continued):

Changes to Special Conditions:

- 1. Added TMDL Reopener allows the permit to be reopened to bring it into compliance with any approved TMDL for the receiving stream
- 2. Updated storm water language to reflect current guidance and conform to the VPDES permit manual

22. Variances/Alternate Limits or Conditions:

The permittee requested and was granted a permit application (Form 2E) testing waiver for BOD₅, TSS, and ammonia at outfalls 001 and 002. These materials are not of substantial concern in once through non-contact cooling water.

Reduced Monitoring - Although a reduction in monitoring frequency for pH and temperature may be considered on a case-by-case basis, a reduction is not being proposed for this facility. This is primarily due to the fact that the facility discharges cooling water into a stream that is classified as natural trout waters. It is believed the current monitoring frequency is justified to ensure the temperature standards are being maintained.

23. Public Notice Information required by 9 VAC 25-31-280 B:

All pertinent information is on file and may be inspected or copied by contacting Lynn V. Wise at:

Virginia DEQ, Blue Ridge Regional Office 3019 Peters Creek Road, Roanoke, VA 24019 Telephone No. (540) 562-6787 E-mail lynn.wise@deq.virginia.gov

Persons may comment in writing or by email to the DEQ on the proposed permit action, and may request a public hearing, during the comment period. Comments shall include the name, address, and telephone number of the writer and of all persons represented by the commenter/requester, and shall contain a complete, concise statement of the factual basis for comments. Only those comments received within this period will be considered. The DEQ may decide to hold a public hearing, including another comment period, if public response is significant and there are substantial, disputed issues relevant to the permit. Requests for public hearings shall state 1) the reason why a hearing is requested; 2) a brief, informal statement regarding the nature and extent of the interest of the requester or of those represented by the requester, including how and to what extent such interest would be directly and adversely affected by the permit; and 3) specific references, where possible, to terms and conditions of the permit with suggested revisions. Following the comment period, the Board will make a determination regarding the proposed permit action. This determination will become effective, unless the DEQ grants a public hearing. Due notice of any public hearing will be given. The public may review the draft permit and application at the DEQ Blue Ridge Regional Office by appointment.

24. Additional Comments:

Previous Board Action: None.

Staff Comments:

A screening for Threatened and Endangered (T&E) Species in the vicinity of the CPFilms facility was performed and a T&E Species Coordination Form package was submitted to the Department of Game and Inland Fisheries, the Department of Conservation and Recreation, and the United States Fish & Wildlife Service. The purpose of the screening is to assure that mixing zones do not impact listed species. The Federally endangered, State endangered (FESE) Roanoke logperch is known to be found in this area. The cooling water discharges are required to meet the in-stream temperature standards at the end-of-pipe. Since no mixing zones are allowed and the effluent limitations contained in this permit will maintain the Water Quality Standards of 9 VAC 25-260-00 et seq., no adverse impacts to this species is expected. Further documentation of the T&E species review can be found in the Agency's files at the Regional Office.

The U.S. Fish and Wildlife Service requested that the following information be relayed to the permittee:

"Due to the fact that the federally endangered Roanoke logperch (*Percina rex*) occurs in the vicinity of the facility discharge points, please remind the permittee to follow the label instructions for *Round-Up* as the surfactant in *Round-Up* can be toxic to aquatic organisms. (The reminder to follow all labelling instructions would apply to any pesticides the facility would use.)

Regarding the water intake structure, please provide the following information to the VPDES permittee:

In order to prevent entrainment and impingement of eggs, larval and post-larval fish, the Service recommends utilizing water intake screen slot openings no greater than 1.0 millimeter and an intake velocity not to exceed 0.25 feet per second. These and other recommendations for intake structures are found in Gowan and Garman (2002) in *Design criteria for fish screens in virginia:* recommendations based on a review of the literature which can be accessed at: http://www.vwrrc.vt.edu/pdfs/proceedings/2002WaterResearchSymposium_proceedings.pdf#page=136

For more information concerning the intake structure and the federally endangered Roanoke logperch which occurs in the vicinity of the water intake, the permittee may contact Tylan Dean of this office at 804 693-6694, extension 166 or by email at: tylan_dean @fws.gov.

Species information and other information regarding project reviews within Virginia are available at http://www.fws.gov/northeast/virginiafield/endspecies/project_reviews.html."

The discharge is not controversial and is currently meeting the required effluent limitations.

Public Comment:

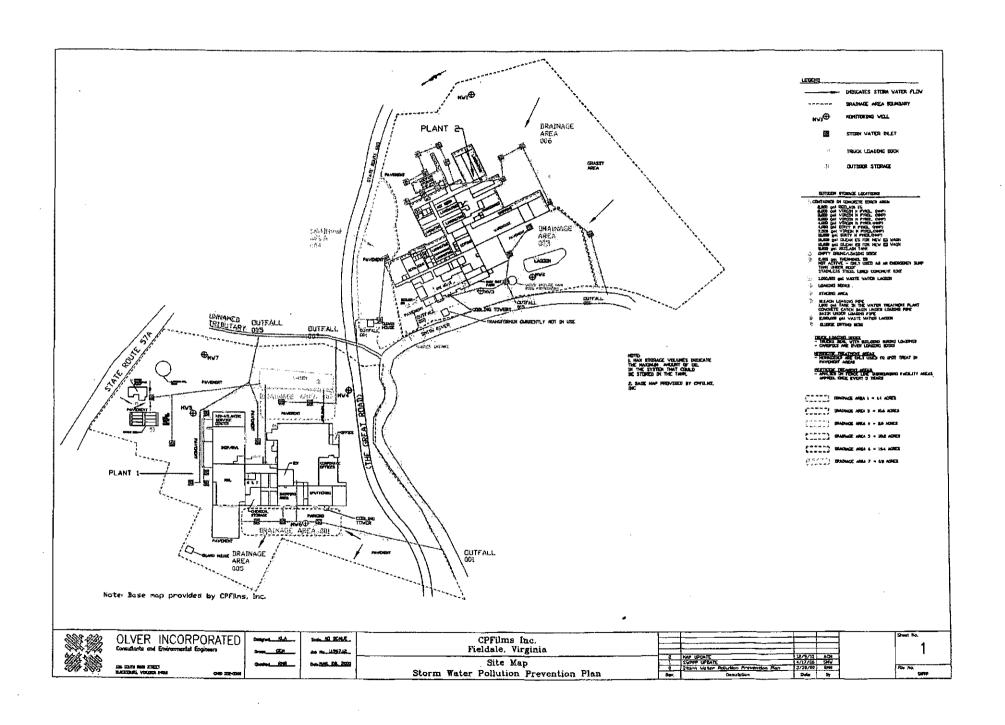

No comments were received.

25. 303(d) Listed Segments (TMDL):

This facility discharges directly to the Smith River. The stream segment receiving the effluent is listed as impaired for bacteria on the current 303(d) list. EPA approved the Bacteria TMDL for the Dan River Watershed (including the Dan River, Blackberry Creek, Byrds Branch, Double Creek, Fall Creek, Leatherwood Creek, Marrowbone Creek, North Fork Mayo River, South Fork Mayo River, Smith River, Sandy Creek, and Sandy River Watersheds) on December 8, 2008. It does not contain a wasteload allocation (WLA) for this discharge. No limit for bacteria is included because the effluent does not contain bacteria.

ATTACHMENT A GENERAL FACILITY INFORMATION

ATTACHMENT TO FORM 2F

CPFilms, Incorporated Fieldale, Virginia

IV.B. Narrative Description of Pollutant Sources

Outfall 001 (Plant 1)

• This drainage basin is almost exclusively runoff from a paved parking lot.

Outfall 003 (Plant 2)

- The storm and roof drains located around the facility discharge to this Outfall.
- · Raw materials are either stored and handled under a roof or inside the building.
- One tank farm is exposed to stormwater, but this area is diked with a three-foot concrete retaining wall
 and bermed with earthen material as a secondary containment. This area also has a liner in place for
 tertiary containment.
- One diked 3,000 gallon emergency dump tank can store Therminal 55.
- The lagoon is sloped to catch stormwater before it can reach the Outfall.
- All solid domestic waste is kept in dumpsters and is removed three times a week by a refuse company.

Outfall 004 (Plant 2)

- The drainage area for this Outfall:
 - Does not contain and industrial processes
 - Includes the front parking lot to the plant and the guard house, and the grassy areas between the parking lot and the guard house

Outfall 005 (Plant 1)

- The storm and roof drains located around the facility, in the landscaping and parking areas, discharge to this Outfall.
- Fertilizers and lime are applied to the facility grounds periodically and the herbicide, "Round-up" is used on an as needed basis for weed control in asphalt and concrete areas.
- All chemicals used for processing are stored inside the main building.
- Stormwater comes into contact with the sludge beds at the WWTP but does not run onto the property

Outfall 006 (Plant 2)

- This Outfall is not monitored because:
 - Discharge to this Outfall does not come into contact with industrial process.
 - The topography includes a grassy field that receives no fertilizers or herbicides.

Outfall 007 (Plant 1)

This drainage basin is almost exclusively runoff from a paved parking lot.

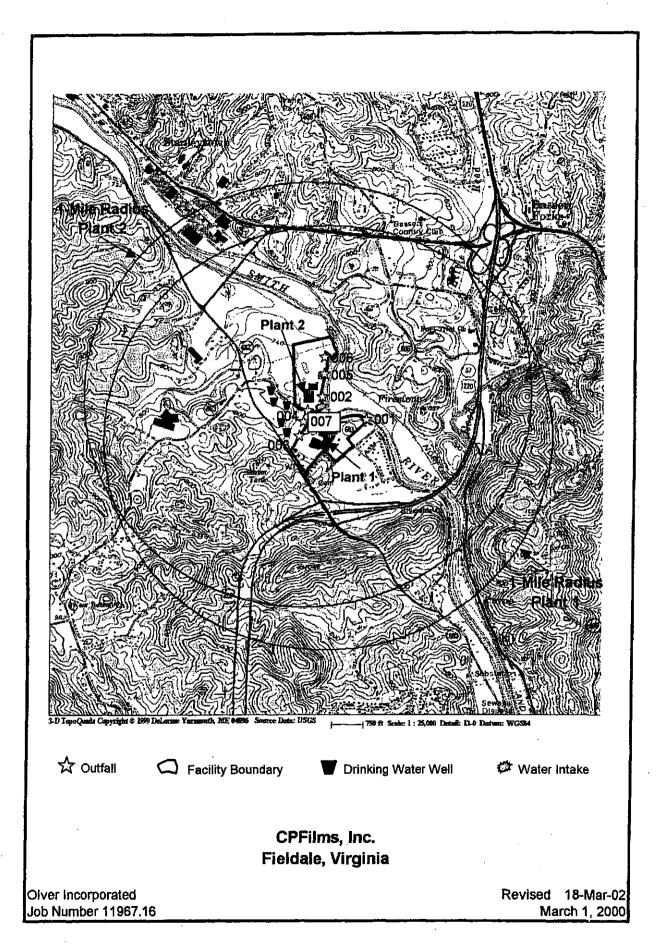

IV.C. Structural Control Measures

Plant 1

Potential pollutants are reduced by vegetative ground cover. Areas around the WWTP are bermed such that runoff is diverted to the WWTP and not the stormwater outfall. Storm and roof drains are located around the facility and discharge to 003.

Plant 2

Potential pollutants are reduced by vegetative ground cover and natural topography. Stormwater runoff is diverted to the respective outfalls using berms and concrete curbing. The tank farm area has tertiary containment.

MEMORANDUM

DEPARTMENT OF ENVIRONMENTAL QUALITY Blue Ridge Regional Office, Water Division

3019 Peters Creek Road

Roanoke, VA 24019

SUBJECT:

Flow Frequency Determination

CPFilms, Incorporated - VPDES Permit No. VA0072354

TO:

File

FROM:

Lynn V. Wise, Environmental Engineer, Sr.

DATE:

October 27, 2010

COPIES:

CPFilms, Inc., discharges via eight outfalls (two non-contact cooling water, six storm water) to the Smith River and its tributaries near Fieldale, VA. Stream flow frequencies are required at these sites for the purpose of calculating effluent limitations for the VPDES permit.

Outfalls 001, 002, 005 and 006 are located on the Smith River. Outfall 006 is the upstream-most discharge point and outfalls 005, 002 and 001 follow in downstream order. All four outfalls are in close proximity to one another. The flow frequencies for outfall 006 were determined using the USGS continuous record gauge on the Smith River at Bassett, VA (#02072500). The gauge is located at the Route 666 bridge, in Bassett, VA, and has been in operation since 1939. The Smith River has been regulated by Philpott Dam since 1950; therefore, the period of record from 1951 through 2003 was used. The flow frequencies for the gauge and outfall 006 are presented below. The values at outfall 006 were determined using proportional drainage areas and should be adjusted to account for the volume discharge by the outfalls upstream in order to determine the flow frequencies for outfalls 005, 002 and 001.

Smith River at Bassett, VA (#02072500):

Drainage Area = 259 mi^2

1Q10 = 49 cfs
7Q10 = 88 cfs
30Q10 = 101 cfs
30Q5 = 115 cfs
1Q30 = 45 cfs
High Flow 1Q10 = 58 cfs
High Flow 7Q10 = 107 cfs
High Flow 30Q10 = 116 cfs
Harmonic Mean = 170 cfs

Smith River above Outfall 006:

Drainage Area = 288.44 mi^2

1Q10 = 54.5 cfs (35.2 mgd) High Flow 1Q10 = 64.6 cfs (41.7 mgd) 7Q10 = 98.0 cfs (63.3 mgd) High Flow 7Q10 = 119.2 cfs (77.0 mgd) 30Q10 = 112.5 cfs (72.7 mgd) High Flow 30Q10 = 129.2 cfs (83.5 mgd)30Q5 = 128.1 cfs (82.8 mgd) Harmonic Mean = 189.3 cfs (122.3 mgd)

1Q30 = 50.11 cfs (32.39 mgd)

The high flow months for the Smith River are February through June.

Flow Frequency Determination CPFilms, Inc.
Page 2

Outfalls 003 and 007 discharge to an intermittent stream and outfall 004 discharges to a dry ditch, which flows to the intermittent stream. The flow frequencies for intermittent streams and dry ditches are 0.0 cfs for the 1Q10, 7Q10, 30Q10, 30Q5, high flow 1Q10, high flow 7Q10, high flow 30Q10, and harmonic mean.

2010 Impaired Waters

Categories 4 and 5 by Impaired Area ID*

Roanoke and Yadkin River Basins

Cause Group Code: L52R-01-BAC

Smith River

Location: The bacteria impairment begins at the Blackberry Creek mouth on Smith River VAW-L52R (Bassett Quad) and extends

downstream to the backwaters of the Martinsville power pool (Martinsville West Quad).

City / County: Henry Co.

Martinsville City

Use(s): Recreation

Cause(s)*/

VA Category: Escherichia coli/ 4A

The 2002 Assessment basis for 303(d) Listing the waters is exceedance of the former fecal coliform (FC) bacteria instantaneous criterion of 1000 cfu/100 ml and the former geometric mean (WQS frequency of 2 samples/calendar month of 200 cfu/100 ml causing the waters to not support the recreational use. Special monitoring on Blackberry Creek (L52R) and the Smith River (L53R) reported and 303(d) Listed these exceedances in 2002.

The Dan River Bacteria Total Maximum Daily Load (TMDL) is U.S. EPA approved 12/8/2008 [Fed ID 35756] and SWCB approved 4/28/2009. The Smith River is encompassed by the overall Dan River Bacteria TMDL Watershed and allocations. Portions of the Smith River are nested within the TMDL Watershed. The TMDL and allocations can be viewed at http://www.deq.virginia.gov.

A portion of the bacteria impaired waters were delisted in 2004 for the area between the Blackberry Creek mouth on the Smith River (L52R Bassett Quad) extending downstream to the Reed Creek confluence on the Smith River L53R- Martinsville West Quad), 2.29 miles. The de-listing of these waters was based on an exceedance rate of less than 10.5%. This portion returned to 303(d) Listing status with the 2006 Integrated Report (IR) based on stations 2000W0034A and 4ASRE036.55. The total bacteria impairment size is 10.18 miles.

4ASRE036.55- There are no additional data beyond the 2008 assessment where E.coli are found to exceed the 235 cfu/100 ml instantaneous criterion in three of 21 samples. Exceeding values range from 250 to 720 cfu/100 ml. 2006 exceedances are 250 and 350 cfu/100 ml from two of nine samples.

4ASRE033.19- The 2010 assessment finds E.coli exceed the instantaneous criterion in nine of 43 observations with excess values ranging from 250 cfu/100 ml to greater than 2000. E.coli exceed the instantaneous criterion in four of 31 samples in 2008. Exceeding values range from 280 to 1000 cfu/100 ml.

Special Study Stations:

2008 E. coli exceedances / total observations; range 2008 / 2006 & 2004 exceedances / total observations; range 2004. 2000W0034B- (downstream of Blackberry Creek confluence)- SS data ends 6/06/02- 1 of 10 at 270 / 2006 & 2004- 2 of 20; 270 to >800

2000W0034A- (located downstream in VAW-L53R)- SS data ends 6/06/02- 1 of 11 exceeds at >800 / 2006 & 2004- 2 of 21; at >800.
